**Recommendations**

This report emphasises the need for assuring accuracy and reliability of HIV rapid testing by applying a quality system approach that addresses continued supervision, development of standard operating procedures, prioritises ongoing training and ensures monitoring and improving of the testing process.

We express our gratitude to the following for assisting with the implementation of the study: District Co-ordinators Z Dladla (Uthukela district), O T Mhlongo (Umgungundlovu district), N Hlongwane (Uthungulu district), P Dladla (Ethekwini district), Z Ncama (Ugu district), B Ncube (Uthukela district) for project co-ordination, and counsellors and nurses at the health facilities for participation in the study.

Views expressed here are personal opinions of the authors and have not been endorsed by manufacturers or any other party cited in this article.

**Intestinal parasitic infections in adult patients in KwaZulu-Natal**

Z I Kwitshana, J M Tsoka, M L H Mabaso

**To the Editor:** Intestinal parasitic infections are among the most common chronic human infections in developing countries, particularly in the tropical and subtropical regions. The major groups of parasites include geohelminths, schistosomes and protozoans that are associated with malnutrition, iron deficiency anaemia, and impaired growth and cognitive development caused by decreased appetite, nutrient loss, malabsorption and decreased nutrient utilisation. However, intestinal parasitic infections receive little attention as most are asymptomatic and generally considered to be of less clinical significance than bacterial and viral infections.

The geographical distribution of intestinal parasites has been shown to coincide with that of HIV/AIDS under conditions of poverty in most countries in sub-Saharan Africa. Interest has therefore increased in the pathological interaction between parasitic infections and HIV/AIDS, particularly in adults.

Regrettably, there are few data on the prevalence of intestinal parasites in the adult population since most surveys focus on school-age children who carry the heaviest morbidity and mortality burden. Similarly, in KwaZulu-Natal (KZN), the third poorest province in South Africa, with a high prevalence of HIV/AIDS in teenagers and middle-aged adult populations, there are scant data on the prevalence of helminth and protozoan infections.

We therefore studied the occurrence of helminth and protozoan infections in adult patients throughout KZN from September 2008, Vol. 98, No. 9 SAMJ
concentration technique,\textsuperscript{7} and screened for intestinal parasites using microscopy. The samples were also cultured in Robinson’s medium to enhance detection of \textit{Entamoeba} species.\textsuperscript{8}

**Results**

The overall prevalence of parasites in 5,733 screened stool samples was 20.4\%. \textit{Ascaris lumbricoides} (10.7\%) and \textit{Trichuris trichiura} (6.7\%) were the most common helminth infections, followed by hookworm and \textit{Schistosoma mansoni}. \textit{Entamoeba coli} and \textit{Endolimax nana} were the most commonly detected protozoan parasites, while \textit{Isospora}, \textit{Cryptosporidia} and other \textit{Coccidia} species were less common (Table I). The prevalence of intestinal parasites varied geographically, with the highest infection rates in coastal regions (Fig. I); this ranged from 30.3\% in Jozini (coastal) to 11.2\% in Newcastle (inland). The highest levels of \textit{A. lumbricoides} were recorded in Port Shepstone, Empangeni and Jozini (18\%, 15\% and 14\% respectively). \textit{T. trichiura} was most prevalent in Jozini, Port Shepstone and Durban regions. Hookworm and schistosoma species were most common in the Jozini region (Table I).

**Discussion**

Our findings suggest that the occurrence and distribution of intestinal parasites among the adult population varies widely

**Helminth infections**

- \textit{Ascaris lumbricoides}: 18.3\% (PS), 10.3\% (DBN), 6.8\% (PMB), 4.0\% (LS), 3.2\% (NC), 15.1\% (EMP), 14\% (JZN), 4.4\% (UL), 10.69\% (Overall).
- \textit{Trichuris trichiura}: 10.2\% (PS), 6.8\% (DBN), 3.4\% (PMB), 2.3\% (LS), 0.7\% (NC), 9\% (EMP), 16\% (JZN), 2.0\% (UL), 6.7\% (Overall).
- \textit{Hookworm species}: 2.8\% (PS), 1.5\% (DBN), 0.3\% (PMB), 0.06\% (LS), 0.02\% (NC), 0.2\% (EMP), 2.9\% (JZN), 0\% (UL), 1.8\% (Overall).
- \textit{Taenia species}: 1.34\% (PS), 0.24\% (DBN), 0.8\% (PMB), 0.6\% (LS), 1.3\% (NC), 1.5\% (EMP), 2.2\% (JZN), 0.78\% (UL), 1.03\% (Overall).
- \textit{Schistosoma mansoni}: 2.0\% (PS), 1.0\% (DBN), 0.0\% (PMB), 0.6\% (LS), 0.0\% (NC), 2.3\% (EMP), 1.2\% (JZN), 0\% (UL), 1.03\% (Overall).
- \textit{Schistosoma haematobium}*: 0.52\% (PS), 0.12\% (DBN), 0\% (PMB), 0\% (LS), 0\% (NC), 0.2\% (EMP), 0.7\% (JZN), 0\% (UL), 0.2\% (Overall).
- \textit{Hymenolepis nana}: 0.1\% (PS), 0.04\% (DBN), 0.25\% (PMB), 0\% (LS), 0.81\% (NC), 0\% (EMP), 1.02\% (JZN), 0.31\% (UL), 0.21\% (Overall).
- \textit{Strongyloides}: 0.52\% (PS), 0.36\% (DBN), 0\% (PMB), 0\% (LS), 0\% (NC), 0\% (EMP), 0\% (JZN), 0\% (UL), 0.26\% (Overall).
- \textit{Enterobius vermicularis}: 0.1\% (PS), 0.04\% (DBN), 0.5\% (PMB), 0\% (LS), 0.32\% (NC), 0\% (EMP), 0.21\% (JZN), 0\% (UL), 0.03\% (Overall).

**Overall**: 35.88\% (PS), 20.4\% (DBN), 12.05\% (PMB), 8.1\% (LS), 6.33\% (NC), 30.52\% (EMP), 42.82\% (JZN), 8.91\% (UL), 21.7\% (Overall).

**Protozoan infections**

- \textit{Giardia lamblia}: 0.5\% (PS), 0.8\% (DBN), 0.5\% (PMB), 0.6\% (LS), 0.3\% (NC), 1.3\% (EMP), 0.3\% (JZN), 1.3\% (UL), 0.7\% (Overall).
- \textit{Cholamastix melel}: 0.2\% (PS), 0.2\% (DBN), 0\% (PMB), 0\% (LS), 0\% (NC), 0.6\% (EMP), 1.0\% (JZN), 0.6\% (UL), 0.3% (Overall).
- \textit{Entamoeba histolytica}: 0.4\% (PS), 0.7\% (DBN), 0.8\% (PMB), 2.3\% (LS), 0.5\% (NC), 0\% (EMP), 0\% (JZN), 0\% (UL), 0.63\% (Overall).
- \textit{Entamoeba coli}: 1.6\% (PS), 2.4\% (DBN), 1.8\% (PMB), 4.5\% (LS), 5.4\% (NC), 3.4\% (EMP), 5.1\% (JZN), 3.4\% (UL), 2.8\% (Overall).
- \textit{Entamoeba hartmani}: 0.72\% (PS), 0.48\% (DBN), 0\% (PMB), 1.12\% (LS), 0.32\% (NC), 0.64\% (EMP), 0\% (JZN), 0.3\% (UL), 0.47\% (Overall).
- \textit{Balantidium coli}: 0\% (PS), 0.24\% (DBN), 0\% (PMB), 0\% (LS), 0\% (NC), 0\% (EMP), 0\% (JZN), 0\% (UL), 0.24\% (Overall).
- \textit{Isospora buschii}: 0.21\% (PS), 0.08\% (DBN), 0.5\% (PMB), 0\% (LS), 0\% (NC), 0\% (EMP), 0\% (JZN), 0.34\% (UL), 0.12\% (Overall).
- \textit{Endolimax nana}: 0.52\% (PS), 1.21\% (DBN), 0.75\% (PMB), 1.69\% (LS), 0.97\% (NC), 0.85\% (EMP), 1.36\% (JZN), 0.63\% (UL), 0.99\% (Overall).
- \textit{Isospora species}: 0\% (PS), 0.38\% (DBN), 0\% (PMB), 0\% (LS), 0\% (NC), 0\% (EMP), 0\% (JZN), 0\% (UL), 0\% (Overall).
- \textit{Cryptosporidia}: 0.1\% (PS), 0.2\% (DBN), 0.75\% (PMB), 0\% (LS), 0\% (NC), 0\% (EMP), 0\% (JZN), 0.31\% (UL), 0.17\% (Overall).
- \textit{Coccidia}: 0.1\% (PS), 0\% (DBN), 0\% (PMB), 0\% (LS), 0\% (NC), 0\% (EMP), 0\% (JZN), 0\% (UL), 0\% (Overall).

**Overall**: 4.15\% (PS), 6.11\% (DBN), 4.35\% (PMB), 10.21\% (LS), 7.79\% (NC), 6.79\% (EMP), 8.4\% (JZN), 7.13\% (UL), 6.01\% (Overall).

\*Overall prevalence from only one health region.

PS = Port Shepstone; DBN = Durban; PMB = Pietermaritzburg; LS = Ladysmith; NC = Newcastle; EMP = Empangeni; JZN = Jozini; UL = Ulundi.

September 2008, Vol. 98, No. 9 SAMJ
across KZN. The most common parasite in all regions was *A. lumbricoides*, except for Jozini in the northern region where *T. trichiura* was the most prevalent. This region also had the highest prevalence of hookworm infections. *S. mansoni* was highest in the coastal regions of Port Shepstone, Durban, Empangeni and Jozini, compared with inland regions such as Pietermaritzburg and Newcastle, where none was detected. The distribution of intestinal parasites in South Africa has been attributed to the occurrence of suitable climatic and/or environmental conditions. Socio-economic differences between rural, urban and peri-urban areas are also important determinants of the risk of infection.

The geographical distribution of the most prevalent protozoan parasites also varied widely across the province, with the highest rate of *E. coli* infections found in the Newcastle and Jozini regions, while *E. nana* was highest in Ladysmith, followed by the Jozini and Durban regions. Poor environmental sanitation including polluted water and food and direct faecal contamination are the main determinants of their occurrence and distribution.

In conclusion, while health facility-based data may be less representative of the actual adult population in the respective health regions in the province, this study nevertheless gives an indication of regions with relatively high prevalences of intestinal parasites in the adult population. This is important for the purpose of developing and implementing effective interventions in the light of the escalating HIV/AIDS pandemic, which has been suggested to be related to helminth parasitic infections in Africa, and also provides useful data for diagnostic laboratories’ parasite screening policies. At the time of data collection, only 8 of the 32 laboratories confirmed that they routinely screened all the submitted stools for parasites. The other participating laboratories indicated that parasite screening is only done upon request by the clinician. Intervention programmes could benefit from routine screening of all stools including the adult population, particularly in areas which are endemic to intestinal parasites and HIV/AIDS.

This study was funded by the South African Medical Research Council. We are also grateful to: Mr J M P Fraser, then Deputy Director, Regional Laboratory Services; the Heads of the Regional Laboratory Services; the Control Technologists-In-Charge of all the participating KZN laboratories; Professor T F H G Jackson and the Amoebiasis Research Unit staff, MRC; Mrs Natasha Morris, Health GIS Centre, Malaria Research Programme, MRC; and Dr David Katerere, PROMEC unit, MRC.
